```

New peptide antagonist of zonulin useful as antiinflammatory agent for

WPI; 2000-205565/18

```
CC (2), one of 25 such peptides (see 1/3107-2) or the complete of the peptide antagonists are based on a common motif of ZOT binding. The peptide antagonists are based on a common motif of ZOT binding. They can be prepared by chemical synthesis or by use of CC and human zonulins, which is believed to be critical for receptor CC recombinant DNA techniques. The peptide antagonists are used as an inflammation, where they bind to the ZOT receptor in the intestinal CC and yet does not physiologically modulate the opening of Ty in the CC intestine. Gastrointestinal inflammation conditions give rise to CC increased intestinal permeability and the peptide is useful for CC caused by infection, e.g. clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite CC mucosal erosion or ulcerations, e.g. gastrilis, gastric cancer collagenous colitis, inflammatory bowel disease, diseases with CC sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical CC correction of congenital heart disease with Fontan's operation, cc collag disease, without ulceration, e.g. Menettier's disease, cc. e.g. systemic lupus erythematosus or food allergies, primarily to

It may also play a role in breast cancer, glioblastomas, and pituitary adenomas. Zneul may also be used to treat Alzheimer's disease, cancer, to repopulate blood cells after chemotherapy, to stimulate myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to regenerate nerves. Claimed Zneul polypeptides (see also w88382-97), including specific domains of Zneul and epitope-bearing portions of Zneul, can be used to raise specific antibodies for use e.g. in

Zneul can be used to treat Alzheimer's disease, cancer, to repopulate blood cells after chemotherapy, to stimulate myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to regenerate nerves. Claimed Zneul polypeptides (see also w88382-97), including specific domains of Zneul and epitope-bearing portions of Zneul, can be used to raise specific antibodies for use e.g. in

The ORFX CC sequences have activities such as: cytostatic; hepatotropic; vulnerary; canticonvulsant; antiparkinsonian; nootropic; neuroprotective; osteopathic; cc cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; cc dermatological; immunosuppressive; antiinflammatory; antibacterial; cc antiviral; antifungal; antirheumatic; antihrproid; and antianaemic. The cc sequences can be used for determining the presence of or predisposition cc offx-associated disorder. The nucleic acids can be used to express ORFX cused to treat cancers, proliferative disorders and nucleic acids may be cf disorders, osteoarthritis, graft vs host disease, cardiovascular disease, cf disorders, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to xxx

                                                                                                                                                                                                                                                                                                                                                                                                                                     CC C74446 to C77606 encode the proteins given in B40237 to B43397, which CC represent the human ORFX open reading frames 1 to 3161. The ORFX CC sequences have activities such as: cytostatic; hepatotropic; vulnerary; CC antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; CC anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cc dermatological; immunosuppressive; antiinflammatory; antibacterial; CC dermatological; immunosuppressive; antiinflammatory; antibacterial; CC antiviral; antifungal; antirheumatic; antiinflammatory; antibacterial; CC sequences can be used for determining the presence of or predisposition or preventing or treating pathological conditions associated with an CC proteins in gene therapy vectors. The proteins and nucleic acids may be CC used to treat cancers, proliferative disorders, neurodegenerative CC disorders, osteoarthritis, graft vs host disease, cardiovascular disease, CC storage, systemic lupus erythematosus, severe combined immunodeficiency CC (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune CC cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.

Zneul is a new neuro-growth factor-like protein that can be used as a growth, maintenance, or differentiation factor in the spinal cord, heart, spleen, testis, thyroid and lymph nodes. Zneul may also play a role in breast cancer, glioblastomas, and pituitary adenomas. Zneul can be used to treat Alzheimer's disease, cancer, to repopulate blood cells after chemotherapy, to stimulate myofibrobiast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to repopulate blood cells after demotherapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC This invention describes novel cDNA sequences (A) highly expressed in CC normal uterine tissue which can have anticancer and cytostatic activity CC and can be used for gene therapy. (A) are used (i) for recombinant CC expression of polypeptides (B) and (ii) to isolate complete genes. (C (B) are used (i) to identify agents suitable for treatment of uterine compared to the complete genes. (A) directly for treating this form of cancer (including CC expression from gene therapy vectors) and (iii) for generation of CC expression from gene therapy vectors) and (iii) for generation of CC expression patterns. (A) are identified by assembling ESTs (expressed CC expression patterns. This allows a significantly longer fragment of the CC expression patterns. This allows a significantly longer fragment of the CC expression patterns. This allows a significantly longer fragment of the CC expression patterns to so should reduce the number of failures associated CC different parts of the same unknown gene, distorting the estimated CC frequency of occurrence in a particular tissue. Y59838-Y59892 represent CC protein fragments encoded by the human uterine tissue derived cDNA xx
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human neuro-growth factor-like protein Zneul mature polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (EGF)-like domains at amino acids 107-134 and 141-176 and is predicted to have a molecular weight of approximately 30kD. T125 is predicted to have rotansmembrane domains and appears to be a secreted protein. The sequences of all variants of T125 are used in the invention to create antibodies which selectively bind to T125. The T125 polypeptide is used to modulate a variety of cellular processes. It can be used to produce to identify T125 antagonists and agonists. The T125 polypucleotides, and polypeptides, homologues and antibodies can be used to produce antibodies, and polypeptides, homologues and antibodies can be used in screening assays; predictive medicine; and methods of treatment of T125 associated disorders. The T125 polynucleotides can be used to express the protein; to detect T125 mRNA; to detect genetic alterations in the T125 gene; in forensic biology; and as a source of primers and probes.
                                                                                                                                                                                                                                                                                                                                                                                 Domain
                                                                                                                                                                                                                                                                                                                                                                                                                       Homo sapiens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This polypeptide comprises human Zneul mature polypeptide. Zneul is a new neuro-growth factor-like protein (see also W88381). Its closest human homologue is HSMHC3W5A, a gene in the HLA class III region, which is contained in a cosmid which contains Notch 4. Zneul is also homologus to Notch 4 in its ECF-like domains and may be involved in ECF receptor pathways. Zneul is widely expressed in adult tissues, with high expression in heart, placenta, spleen, testis, thyroid, spinal cord and lymph node. Zneul can be used as a growth, maintenance, or differentiation factor in the spinal cord, heart, spleen, testis, thyroid and lymph nodes. It may play a role in breast cancer, glioblastomas, and pituitary play a role in breast cancer, glioblastomas, and pituitary play a role in breast cancer, glioblastomas, and pituitary cancer, to repopulate blood cells after chemotherapy, to stimulate myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to regenerate nerves. Claimed Zneul polypeptides (see also W88382-97), including specific domains of Zneul and epitope-bearing portions of changes contraceptions are used to raise specific antibodies for use e.g. in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              dermatological; immunosuppressive; antiinflammatory; antibacterial; antifural; antifungal; antirheumatic; antifutyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORRY-associated disorder. The nucleic acids can be used to express ORFY proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, amplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. 233891 to 234338, and Y41685 to Y41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             07-DEC-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 199

                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. 23891 to 234338, and val685 to val774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention.

                                                                                                                                                                                        The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. 233891 to 234338, and 241685 to 241774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention.

RT beta-1, 4N-acetylglucosaminyltransferase III from rat kidney.";

RI J. Biol. Chem. 267:18199-18204(1992).

C -!- FUNCTION: IT IS INVOLVED IN THE REGULATION OF THE BIOSYNTHESIS AND BIOLOGICAL FUNCTION OF GLYCOPROTEIN OLIGOSACCHARIDES. CATALYZES

C HEADDITION OF N-ACETYLGLUCOSAMINE IN BETA 1-4 LINKAGE TO THE GHANN. IT IS ONE OF THE TRIMANOSYL CORE OF N-LINKED SUGAR.

C CHAINS. IT IS ONE OF THE MOST IMPORTANT ENZYMES INVOLVED IN THE CHANN. IT IS ONE OF THE MOST IMPORTANT ENZYMES INVOLVED IN THE CHANN. IT IS ONE OF THE MOST IMPORTANT ENZYMES INVOLVED IN THE CHANN. IT IS ONE OF THE MOST INFORMANCE TO FALCHARIDES.

C CATALYTIC ACTIVITY: UDP-N-ACETYL-D-GLUCOSAMINE + N-ACETYL-BETA-D-GLUCOSAMINYL-1, 2-ALPHA-D-MANNOSYL-1, 3-(N-ACETYL-BETA-D-HANNOSYL-1, 4-N-ACETYL-BETA-D-GLUCOSAMINYL-1, 2-ALPHA-D-MANNOSYL-1, 5)-BETA-D-GLUCOSAMINYL-1, 2-ALPHA-D-MANNOSYL-1, 6)-N-ACETYL-BETA-D-GLUCOSAMINYL-1, 2-ALPHA-D-GLUCOSAMINYL-1, 2-ALPHA-D-GLUCOSAMINYL-1, 2-ALPHA-D-GLUCOSAMINYL-1, 2-ALPHA-D-GLUCOSAMINYL-1, 4-N-ACETYL-BETA-D-GLUCOSAMINYL-1, 2-ALPHA-D-GLUCOSAMINYL-1, 4-N-ACETYL-BETA-D-GLUCOSAMINYL-1, 2-ALPHA-D-GLUCOSAMINYL-1, 4-N-ACETYL-BETA-D-GLUCOSAMINYL-1, 4-N-ACETY
